

HumanActivityRecognition

This project is to build a model that predicts the human activities such as Walking, Walking_Upstairs, Walking_Downstairs, Sitting, Standing or Laying.

This dataset is collected from 30 persons(referred as subjects in this dataset), performing different activities with a smartphone to their waists. The data is recorded with the help of sensors (accelerometer and Gyroscope) in that smartphone. This experiment was video recorded to label the data manually.

How data was recorded

By using the sensors(Gyroscope and accelerometer) in a smartphone, they have captured '3-axial linear acceleration'($tAcc-XYZ$) from accelerometer and '3-axial angular velocity' ($tGyro-XYZ$) from Gyroscope with several variations.

prefix 't' in those metrics denotes time.

suffix 'XYZ' represents 3-axial signals in X , Y, and Z directions.

Feature names

1. These sensor signals are preprocessed by applying noise filters and then sampled in fixed-width windows(sliding windows) of 2.56 seconds each with 50% overlap. ie., each window has 128 readings.
2. From Each window, a feature vector was obtained by calculating variables from the time and frequency domain.

In our dataset, each datapoint represents a window with different readings

3. The acceleration signal was saperated into Body and Gravity acceleration signals(**$tBodyAcc-XYZ$** and **$tGravityAcc-XYZ$**) using some low pass filter with corner frequency of 0.3Hz.
4. After that, the body linear acceleration and angular velocity were derived in time to obtian *jerk signals* (**$tBodyAccJerk-XYZ$** and **$tBodyGyroJerk-XYZ$**).
5. The magnitude of these 3-dimensional signals were calculated using the Euclidian norm. This magnitudes are represented as features with names like **$tBodyAccMag$** , **$tGravityAccMag$** , **$tBodyAccJerkMag$** , **$tBodyGyroMag$** and **$tBodyGyroJerkMag$** .
6. Finally, We've got frequency domain signals from some of the available signals by applying a FFT (Fast Fourier Transform). These signals obtained were labeled with **prefix 'f'** just like original signals with **prefix 't'**. These signals are labeled as **$fBodyAcc-XYZ$** , **$fBodyGyroMag$** etc.,.
7. These are the signals that we got so far.

- **$tBodyAcc-XYZ$**

- tGravityAcc-XYZ
- tBodyAccJerk-XYZ
- tBodyGyro-XYZ
- tBodyGyroJerk-XYZ
- tBodyAccMag
- tGravityAccMag
- tBodyAccJerkMag
- tBodyGyroMag
- tBodyGyroJerkMag
- fBodyAcc-XYZ
- fBodyAccJerk-XYZ
- fBodyGyro-XYZ
- fBodyAccMag
- fBodyAccJerkMag
- fBodyGyroMag
- fBodyGyroJerkMag

8. We can estimate some set of variables from the above signals. ie., We will estimate the following properties on each and every signal that we recorded so far.

- **mean()**: Mean value
- **std()**: Standard deviation
- **mad()**: Median absolute deviation
- **max()**: Largest value in array
- **min()**: Smallest value in array
- **sma()**: Signal magnitude area
- **energy()**: Energy measure. Sum of the squares divided by the number of values.
- **iqr()**: Interquartile range
- **entropy()**: Signal entropy
- **arCoeff()**: Autorregresion coefficients with Burg order equal to 4
- **correlation()**: correlation coefficient between two signals
- **maxInds()**: index of the frequency component with largest magnitude
- **meanFreq()**: Weighted average of the frequency components to obtain a mean frequency
- **skewness()**: skewness of the frequency domain signal
- **kurtosis()**: kurtosis of the frequency domain signal
- **bandsEnergy()**: Energy of a frequency interval within the 64 bins of the FFT of each window.
- **angle()**: Angle between two vectors.

9. We can obtain some other vectors by taking the average of signals in a single window sample. These are used on the angle() variable'

- gravityMean
- tBodyAccMean
- tBodyAccJerkMean
- tBodyGyroMean
- tBodyGyroJerkMean

Y_Labels(Encoded)

- In the dataset, Y_labels are represented as numbers from 1 to 6 as their identifiers.

- WALKING as **1**
- WALKING_UPSTAIRS as **2**
- WALKING_DOWNSTAIRS as **3**
- SITTING as **4**
- STANDING as **5**
- LAYING as **6**

Train and test data were saperated

- The readings from **70%** of the volunteers were taken as **training data** and remaining **30%** subjects recordings were taken for **test data**

Data

- All the data is present in 'UCI_HAR_dataset/' folder in present working directory.
 - Feature names are present in 'UCI_HAR_dataset/features.txt'
 - **Train Data**
 - 'UCI_HAR_dataset/train/X_train.txt'
 - 'UCI_HAR_dataset/train/subject_train.txt'
 - 'UCI_HAR_dataset/train/y_train.txt'
 - **Test Data**
 - 'UCI_HAR_dataset/test/X_test.txt'
 - 'UCI_HAR_dataset/test/subject_test.txt'
 - 'UCI_HAR_dataset/test/y_test.txt'

Data Size :

27 MB

Quick overview of the dataset :

- Accelerometer and Gyroscope readings are taken from 30 volunteers(referred as subjects) while performing the following 6 Activities.
 1. Walking
 2. WalkingUpstairs
 3. WalkingDownstairs
 4. Standing
 5. Sitting
 6. Lying.
- Readings are divided into a window of 2.56 seconds with 50% overlapping.

- Accelerometer readings are divided into gravity acceleration and body acceleration readings, which has x,y and z components each.
- Gyroscope readings are the measure of angular velocities which has x,y and z components.
- Jerk signals are calculated for BodyAcceleration readings.
- Fourier Transforms are made on the above time readings to obtain frequency readings.
- Now, on all the base signal readings., mean, max, mad, sma, arcoefficient, engerybands,entropy etc., are calculated for each window.
- We get a feature vector of 561 features and these features are given in the dataset.
- Each window of readings is a datapoint of 561 features.

Problem Framework

- 30 subjects(volunteers) data is randomly split to 70%(21) test and 30%(7) train data.
- Each datapoint corresponds one of the 6 Activities.

Problem Statement

- Given a new datapoint we have to predict the Activity

```
In [1]: import numpy as np
import pandas as pd

# get the features from the file features.txt
features = list()
with open('UCI_HAR_Dataset/features.txt') as f:
    features = [line.split()[1] for line in f.readlines()]
print('No of Features: {}'.format(len(features)))
```

No of Features: 561

Obtain the train data

```

In [2]: # get the data from txt files to pandas dataframe
X_train = pd.read_csv('UCI_HAR_dataset/train/X_train.txt', delim_whitespace=True)

# add subject column to the dataframe
X_train['subject'] = pd.read_csv('UCI_HAR_dataset/train/subject_train.txt', header=0)

y_train = pd.read_csv('UCI_HAR_dataset/train/y_train.txt', names=['Activity'], skiprows=1)
y_train_labels = y_train.map({1: 'WALKING', 2: 'WALKING_UPSTAIRS', 3: 'WALKING_DOWNSTAIRS',
                               4: 'SITTING', 5: 'STANDING', 6: 'LAYING'})

# put all columns in a single dataframe
train = X_train
train['Activity'] = y_train
train['ActivityName'] = y_train_labels
train.sample()

```

C:\Users\Admin\Anaconda3\lib\site-packages\pandas\io\parsers.py:678: UserWarning: Duplicate names specified. This will raise an error in the future.

Out[5]: (2947, 564)
```

Data Cleaning

1. Check for Duplicates

```
In [6]: print('No of duplicates in train: {}'.format(sum(train.duplicated())))
print('No of duplicates in test : {}'.format(sum(test.duplicated())))
```

```
No of duplicates in train: 0
No of duplicates in test : 0
```

2. Checking for NaN/null values

```
In [7]: print('We have {} NaN/Null values in train'.format(train.isnull().values.sum()))
print('We have {} NaN/Null values in test'.format(test.isnull().values.sum()))
```

We have 0 NaN/Null values in train
We have 0 NaN/Null values in test

3. Check for data imbalance

```
In [8]: import matplotlib.pyplot as plt
import seaborn as sns

sns.set_style('whitegrid')
plt.rcParams['font.family'] = 'Dejavu Sans'
```

```
In [11]: plt.figure(figsize=(16,8))
plt.title('Data provided by each user', fontsize=20)
sns.countplot(x='subject', hue='ActivityName', data = train)
plt.show()
```

We have got almost same number of reading from all the subjects

```
In [14]: plt.title('No of Datapoints per Activity', fontsize=15)
sns.countplot(train.ActivityName)
plt.xticks(rotation=90)
plt.show()
```

Observation

Our data is well balanced (almost)

4. Changing feature names

```
In [16]: columns = train.columns

# Removing '()' from column names
columns = columns.str.replace('[(\)]', '')
columns = columns.str.replace('[-]', '')
columns = columns.str.replace('[,]', '')

train.columns = columns
test.columns = columns

test.columns

Out[16]: Index(['tBodyAccmeanX', 'tBodyAccmeanY', 'tBodyAccmeanZ', 'tBodyAccstdX',
               'tBodyAccstdY', 'tBodyAccstdZ', 'tBodyAccmadX', 'tBodyAccmadY',
               'tBodyAccmadZ', 'tBodyAccmaxX',
               ...
               'angletBodyAccMeangravity', 'angletBodyAccJerkMeangravityMean',
               'angletBodyGyroMeangravityMean', 'angletBodyGyroJerkMeangravityMean',
               'angleXgravityMean', 'angleYgravityMean', 'angleZgravityMean',
               'subject', 'Activity', 'ActivityName'],
              dtype='object', length=564)
```

5. Save this dataframe in a csv files

```
In [17]: train.to_csv('UCI_HAR_Dataset/csv_files/train.csv', index=False)
         test.to_csv('UCI_HAR_Dataset/csv_files/test.csv', index=False)
```

Exploratory Data Analysis

"Without domain knowledge EDA has no meaning, without EDA a problem has no soul."

1. Featuring Engineering from Domain Knowledge

- **Static and Dynamic Activities**
 - In static activities (sit, stand, lie down) motion information will not be very useful.
 - In the dynamic activities (Walking, WalkingUpstairs, WalkingDownstairs) motion info will be significant.

2. Stationary and Moving activities are completely different

```
In [18]: sns.set_palette("Set1", desat=0.80)
facetgrid = sns.FacetGrid(train, hue='ActivityName', size=6,aspect=2)
facetgrid.map(sns.distplot,'tBodyAccMagmean', hist=False)\
.add_legend()
plt.annotate("Stationary Activities", xy=(-0.956,17), xytext=(-0.9, 23), size=20,
            va='center', ha='left',\
            arrowprops=dict(arrowstyle="simple",connectionstyle="arc3,rad=0.1"))

plt.annotate("Moving Activities", xy=(0,3), xytext=(0.2, 9), size=20,\
            va='center', ha='left',\
            arrowprops=dict(arrowstyle="simple",connectionstyle="arc3,rad=0.1"))
plt.show()
```

3. Magnitude of an acceleration can saperate it well

```
In [24]: plt.figure(figsize=(7,7))
sns.boxplot(x='ActivityName', y='tBodyAccMagmean', data=train, showfliers=False,
plt.ylabel('Acceleration Magnitude mean')
plt.axhline(y=-0.7, xmin=0.1, xmax=0.9, dashes=(5,5), c='g')
plt.axhline(y=-0.05, xmin=0.4, dashes=(5,5), c='m')
plt.xticks(rotation=90)
plt.show()
```

__ Observations __:

- If tAccMean is < -0.8 then the Activities are either Standing or Sitting or Laying.
- If tAccMean is > -0.6 then the Activities are either Walking or WalkingDownstairs or WalkingUpstairs.
- If tAccMean > 0.0 then the Activity is WalkingDownstairs.
- We can classify 75% the Activity labels with some errors.

4. Position of GravityAccelerationComponents also matters

```
In [17]: sns.boxplot(x='ActivityName', y='angleXgravityMean', data=train)
plt.axhline(y=0.08, xmin=0.1, xmax=0.9, c='m', dashes=(5,3))
plt.title('Angle between X-axis and Gravity_mean', fontsize=15)
plt.xticks(rotation = 40)
plt.show()
```

___ Observations___:

- If $\text{angleXgravityMean} > 0$ then Activity is Laying.
- We can classify all datapoints belonging to Laying activity with just a single if else statement.

```
In [18]: sns.boxplot(x='ActivityName', y='angleYgravityMean', data = train, showfliers=False)
plt.title('Angle between Y-axis and Gravity_mean', fontsize=15)
plt.xticks(rotation = 40)
plt.axhline(y=-0.22, xmin=0.1, xmax=0.8, dashes=(5,3), c='m')
plt.show()
```

Apply t-sne on the data

```
In [46]: import numpy as np
from sklearn.manifold import TSNE
import matplotlib.pyplot as plt
import seaborn as sns
```

```
In [47]: # performs t-sne with different perplexity values and their repective plots..

def perform_tsne(X_data, y_data, perplexities, n_iter=1000, img_name_prefix='t-sne'):

    for index,perplexity in enumerate(perplexities):
        # perform t-sne
        print('\nperforming tsne with perplexity {} and with {} iterations at max'.format(perplexity, n_iter))
        X_reduced = TSNE(verbose=2, perplexity=perplexity).fit_transform(X_data)
        print('Done..')

        # prepare the data for seaborn
        print('Creating plot for this t-sne visualization..')
        df = pd.DataFrame({'x':X_reduced[:,0], 'y':X_reduced[:,1] , 'label':y_data[index]})
